A&M Joins Colleges in Study of Air

A&M will join 13 of the nation's top schools of science in establishing a university network for atmospheric research and teaching. According to Dr. Donald W. Hood, associate professor in the Department of Chemistry and Meteorology, the present program began in 1954, with appointment of William Barkas, chairman of the Department of Atmospheric Science, as the Director of the A&M System, to head a new school dedicated to research in all phases of atmospheric studies. The School of Atmospheric Science at Oklahoma State University has already been established.

The two men are here through the aid of the International Cooperation Administration and the Division of International Education of the National Academy of Sciences. The present program will be completed by the end of the academic year.

Livestock Auction School Planned

A livestock auction school will be organized at the University of Missouri by Dr. J. E. C. Mills, acting director of the Department of Agricultural Economics. Dr. Mills will be assisted by Dr. F. A. Martin, head of the Department of Agricultural Economics, and Dr. W. H. Smith, assistant professor of agricultural economics.

The purpose of the conference, according to Dr. Mills, is to organize the livestock auction industry with new developments in its field and with changes in the general marketing field. Representatives from approximately 25 states are expected to attend the conference.

Adair Joining In Guatemala City

Dr. C. W. Adair, head of the Department of Horticulture, left Saturday on a month's stay in Guatemala City, Guatemala. He will work in connection with the International Co-operation Administration in improving the marketing of agricultural crops in Guatemala. Dr. Adair will work with Louis Franke, a representative of the U.S. Operations Mission, during his stay in Guatemala.

Water Use May Be Reality

Fresh water from the sea at a cost of $1.00 a month to the average family may be a reality soon, according to Dr. Donald W. Hood, associate professor in the Department of Chemistry and Meteorology. The average family would use about 10,000 gallons of water a month, at a cost of 75 cents per 1,000 gallons. This figure may still be increased, but Hood believes that the water might be extracted from salt water by use of certain organic solvents. This is just one of numerous ideas being investigated by scientists throughout the world, the result of which may yet be critical, Hood said.
