

CRANETILT THREE-VALVE, LIFTING-TYPE STEAM TRAP

WHAT IS A STEAM TRAP?

A successful steam trap should be a passageway for water and a barrier to steam. It prevents the loss of any steam while it disposes of the accumulated condensation from pipe-lines and headers. Or drains receivers, drip pockets or steam using appliances. It is automatic, performing its important function without attention.

Steam traps of the right type, properly arranged, will return hot condensation directly to the boilers as pure feed water. Conserving the "heat of the liquid" of this condensate, they effect large fuel economies. They

are the most economical devices on the market for boiler feeding. Steam traps can also be used to draw condensation from low pressures or vacuums, discharging directly into a higher pressure, and metering the discharge if desired.

Cranetilt traps perform these and similar functions in many important power plants, in chemical plants, paper mills and oil refineries. Their operation is fully described in a Crane publication entitled "Condensation." We will be glad to send a copy to any engineering student who writes for it.

1926 SENIOR RINGS CONTRACTED FOR

An engraving has been received by the 1926 ring committee from the Chas. H. Elliott Company of Pennsylvania, showing the finished design for the 1926 Senior ring. The design, while the same as the design of past rings, will be clearer and plainer as to detail and engraving. A new feature of the rings will be a protective guard which is to prevent the ring from cutting the finger. According to the contract the rings will be ready to distribute when school starts next fall. It will be impossible for any rings to be delivered during the summer. Those who wish to have their rings in September will have to place their order and a five dollar deposit with C. R. Dollinger, 303 Bizzell, before the closing of school.
