

### School for Firemen Is Held at A. & M.

The first annual school for firemen was held at the A. and M. College Monday and Tuesday, under the auspices of the Department of Chemistry and Chemical Engineering, and the Bryan Fire Department.

The program consisted of a variety of helpful and constructive lectures as well as some few demonstrations and exhibitions given by faculty members and delegates to the school.

It is hoped that the short course will become an annual affair at the college. There were 177 delegates present.

### AG. ENGINEERS TO HAVE MANY SHOWS

The various methods of irrigating and the importance of irrigation in present day agriculture demonstrated to the visitors by a model irrigation system including terraced fields, will be the highlight of the Agricultural Engineering Department's contribution to the Engineering exhibits Saturday.

Other features will include various layouts of farms, model farm buildings, cotton strippers, farm tractors, a combined harvester-thresher, electric lighting plants, water supply systems, and other practical equipment typifying modern agriculture.

### Small Countryside Presented by C. E.'s

Exhibits contributed to the Engineering Show, Saturday, by the Civil Engineering Department will be in three sections, materials and highways, municipal and sanitary and hydraulics. A miniature countryside, a composition of the work of many students, including railways, towns, buildings, highways, bridges, and trestles, watertowers embankments and tunnels, will be on display.

The material and highway section has placed highway signs to direct visitors to the various displays and exhibits in the building. The most outstanding exhibits and displays are of asphalt produced in Texas and made into Texas pavements with methods of testing this road material. Steel will be made to behave like rubber bands with the aid of testing machines from the strength-of-materials laboratory.

The municipal and sanitary section will exhibit the Imhoff tank, operate the aeration unit and remove the coloring matter from water.

The hydraulics section will demonstrate some of the applications of water for power and irrigation purposes, and as a side-light, prove that water will flow up hill.
