Echols is named dean of College of Architecture

Ralph Gordon Echols, currently chairman of the Architecture Department at Miami University of Ohio, has been named associate dean of TAMU's College of Architecture and Environmental Design.

Echols succeeds Prof. Richard E. Vrooman who is returning to full-time teaching.

Echols has been professor of architecture and departmental chairman at the Oxford, Ohio, institution since 1971. He previously taught for 11 years at Virginia Polytechnic Institute and State University and served one year as visiting critic at California State Polytechnic College.

He holds two degrees from V.P.I.: a B.S. in building design and M.S. in architecture. He also holds a master's degree in architecture from Harvard and a master's degree in city planning from the University of Pennsylvania.

Ralph Gordon Echols

While at V.P.I. Echols served as campus architect on a part-time

basis for two years and one year as a consultant for the Cooperative Extension Division of the Community Development Program.

He was a partner in an architects, planners and engineers firm in Blacksburg, Va., from 1961 until 1965, when he formed his own firm for consulting and related activities.

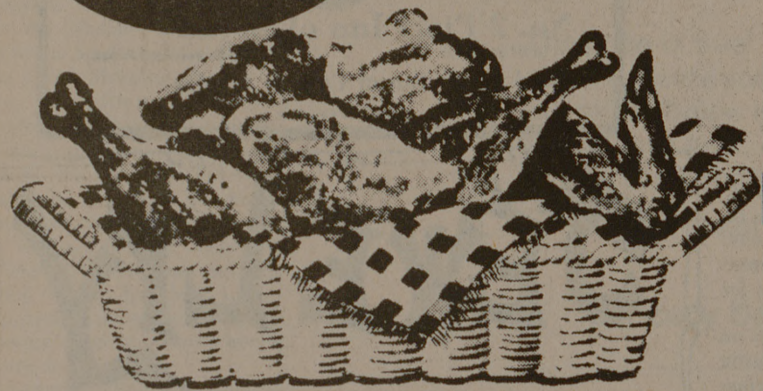

Echols has spent considerable time in Mexico and Guatemala on surveys and excavations of pre-Columbian cities. He has also worked in Colombia and Ireland as a planning consultant for higher education projects.

He is a member of the American Institute of Architects, American Institute of Planners, American Society of Planning Officials and the Association of Collegiate Schools of Architecture. He was awarded a Mellon fellowship for his studies at the University of Pennsylvania and was selected for the Danforth Associate Program.

TAMU to study roaches

The Environmental Protection Agency has granted \$30,000 to the TAMU Department of Entomology for research into the control of urban cockroaches.

Project head Dr. Gordon W. Frankie said one of the main objectives is to reduce the amount of insecticides used in urban areas. It's believed that 500 million pounds of pesticides were sold to industry, public agencies and homeowners in 1970 alone.

"Cockroaches are not known to be vectors of disease but they are known to carry disease-producing organisms and therefore are a potential danger," Frankie said. "They also have nauseating habits like defecating and regurgitating in the food they are eating and some varieties have a foul odor."

"One way to minimize insecticide usage is to learn more about roaches in their urban habitats and to develop measures for suppressing them using a program of chemical biological and habitat control," he said.

"Right now, there is virtually no information of the habits and habitats of cockroaches available," Frankie said. "So we can assume that application of insecticides result in low percentage kills, overuse and waste of chemicals and an increase in the roaches resistance to insecticides."

The team's research has resulted in some of the first literature produced on the outdoor habits of cockroaches. They are also developing data on the roach's natural enemy, a small parasitic wasp that destroys roach eggs.

Frankie said that the research was not just for the middle-class. He said that psychologists contend that removal of the pest from poor and low cost housing, where they notoriously collect and breed, will actually improve the mental health of the people who live there.
