# Eastern quake a matter of time

United Press International  
WASHINGTON — Although major earthquakes east of the Mississippi are rare, the discovery of a fault in Arkansas that caused the worst earthquake in U.S. history raises questions about when the next big one will strike the East.

U.S. Geological Survey scientists blame the newly-discovered fault in the northwest corner of Arkansas for a series of three earthquakes that violently altered the land surface over a wide area in Arkansas, Missouri, Tennessee and Kentucky in 1811 and 1812.

"Forests were flattened, large areas of land sank and rapids formed in the Mississippi River, which was even said to run upstream for a while," said Dr. Robert Wesson of the USGS.

Few people died in the quake, estimated to have hit ranked 7 or 7.5 on the Richter scale, because the area was sparsely populated at the time.

If the same quake occurred today, however, scientists say thousands of persons in an area stretching from St. Louis, Mo. to Memphis, Tenn. could be killed.

Earthquake specialists say another major quake will "unquestionably" occur in the East. The big question is when.

"It's commonly accepted wisdom that more earthquakes are inevitable," said Dr. Robert Hamilton, a USGS geophysicist. "The processes that cause these earthquakes have gone on for millions of years and will continue."

Records of eastern quakes go back over 250 years, but that is insignificant in terms of geological time to give scientists any insights as to

when the next major quake will come. "We simply don't have enough record to predict," Hamilton said in an interview.

The East's second largest recorded earthquake occurred in Charleston, S.C. in 1886. Some people died in that tremor which destroyed much of the city.

Tremors continue today in areas of both big quakes. "There is earthquake activity in the Charleston area all the way to New Madrid, Ark., and the 1811-12 quakes, some measured on the Richter scale, and 5 on the Richter scale."

In fact, the USGS reports 3,500 tremors of varying intensity have been reported east of the Mississippi since 1700.

Hamilton said the discovery of the Arkansas fault is important because it allows scientists to "link past with specific geological structures."

The fault was discovered last summer by a team of geologists including Hamilton, Mark David Russ, Anthony Stanley Broekman.

Hamilton said that most now is not oriented to predict earthquakes but toward understanding geological structures and prone areas so that engineers can design buildings with these in mind.

Eastern tremors, unlike those occurring in California, are caused by flexing of the huge plate of crust that forms the continent of North America. California tremors result from "slipping and sliding" of the Pacific and North American plates.
