**Picnic at Hanging Rock**

Everything begins and ends at exactly the right time and place. Miranda speaks those words just before she leads three friends to ascend Hanging Rock, a geological formation in Australia. The three mysteriously disappear, as does the middle-aged teacher chaperoning the girls. One girl is later found alive, but she has no recollection of what happened. As director Peter Weir probes the enigmatic puzzle, he dissects the stifling repression of Victorian Australia.

# A&M researchers track Gulf of Mexico currents

By Anne Dejoie  
 Reporter

Cooperation among the Mexican navy, the U.S. Minerals Management Service and researchers from Texas A&M resulted in a successful one-year study of ocean currents in the Gulf of Mexico.

The study, which ended last summer, tracked a large eddy that was moving westward against the main current, A&M oceanographer David Brooks said.

The eddies are energetic currents that move warm salty water into the gulf, Brooks said. These eddies run into the bottom waters and affect

how the currents act on the continental shelf and slope.

Researchers mapped the eddy's evolution and are using the data to determine the current's history, Brooks said.

He said the study will help both Mexico and the United States because the countries have many of the same coastline interests.

Researchers worked with the Mexican navy since Mexico controls much of the gulf, Brooks said. He said the researchers had to be prepared to go into international waters, and asking Mexico's help was a good-neighbor policy.

The Mexican navy also provided

the use of its research ship, the "Altair," which was used along with a smaller ship from Louisiana, Brooks said. Ironically, the Mexican ship is a U.S. vessel on long-term loan to the Mexican navy, he said.

Brooks said both countries needed each other in the study; the U.S. had the means to do it, and Mexico had control of the water.

"I feel it was an ideal symbiosis in many ways," Brooks said. "I think both sides are pleased with the results."

He added that while several meetings will be held this fall to organize and discuss the results, the final report is at least a year away.

# Results of bugging probe to go to grand jury, FBI says

AUSTIN (AP) — FBI officials said Monday they plan to present to a grand jury — probably before the Nov. 4 election — results of a probe into the alleged bugging of an aide to Republican gubernatorial candidate Bill Clements.

"We're still plugging along in a very specific direction," said Byron Sage, agent-in-charge of the Austin FBI office.

Asked if the case would reach the grand jury before the election, Sage replied, "I feel very confident of it."

Clements, Texas' first Republican governor in 100 years, is challenging incumbent Gov. Mark White, the Democrat who ousted him after a single term in 1982.

Both candidates have denied any knowledge of the bugging.

Authorities questioned aides in both campaigns, along with at least one newspaper reporter. Sage said

authorities have begun giving lie detector tests to some people, although he declined to specify to whom.

The investigation began Oct. 5, when an electronic listening device was discovered behind a picture in the office of Karl Rove, an Austin-based political consultant working as chief strategist for the Clements campaign.

While Clements' campaign officials didn't blame anyone specifically for planting the matchbook-sized bug, they did say their opponent would have the most to gain.

But Mark McKinnon, press secretary for White, said the Democrat's campaign is blameless. He voiced hope Monday that the case is solved quickly.

"We know that nobody associated with the Mark White campaign had anything to do with the matter, and

that would leave only one other conclusion," McKinnon said.

He said the bugging has distracted attention from the real issues of the White-Clements race.

"There's no question about it," McKinnon said. "We were extremely concerned when this whole matter came up because it distracted from the issues. We were pleased with the direction of the campaign and our momentum. We hope there is an immediate resolution of this (bugging) matter."

John Weaver, a Clements campaign official, said the Republican side also wants a quick resolution of the affair.

"We want to get to the bottom of this, just like everybody else," Weaver said. "We're the victims in this whole affair. We're hopeful the FBI and other authorities can find who did this and punish them."

## Corpus beaches closed to swimmers

# 'Red tide' could remain for months

CORPUS CHRISTI (AP) — A toxic red tide clinging to the coastline has moved into Mexican waters and could linger until the year's end if temperatures do not drop, officials said Monday.

The red tide, an explosion of microscopic organisms, has killed millions of small fish since it appeared in late August near Galveston to the north. It moved into Mexican water last week.

Officials in this city of 250,000 have closed area beaches to swimmers. The oyster harvest, scheduled to open Nov. 1, has been suspended from south of Galveston to the Mexican border.

Officials said the red tide's presence depends on a concentration of organisms, wind direction, wind speed and the water temperature.

For now, state officials and businessmen are hoping for a cold front that could kill the red tide.

The water temperature has been in the upper 70s, said officials, and it must dip to 60 degrees or lower to hinder the red tide. That, they said, may not occur until mid-December.

"And it may be later than that depending on the season," said Pat Patterson, a forecaster at the National Weather Service in Corpus Christi.

Dr. Frank Judd, director of the Pan American University Coastal Studies Laboratory at South

Padre Island, said the water temperature in far south Texas is still in the 80s.

"It needs to get below 60 degrees Fahrenheit and it also depends on what kind of cold front we get," Judd said. "We don't get any persistent cold weather until late November or December."

Hal Osburn, harvest program leader for the Texas Parks and Wildlife Department's marine laboratory in Rockport, said an aerial flight to look at the red tide is scheduled for Tuesday.

He said the red tide was about one to four miles wide from Port O'Connor to the Mexican border, a distance of about 170 miles.

"It could be up to 3,000 square miles of the Gulf of Mexico that has some red tide in it," Osburn said.

The red tide has killed pinheads, headheads, catfish, mullets and some large redfish, Judd said.

He said the worst day for the red tide was last Thursday when people were coughing and experiencing irritated eyes and noses because of the toxins.

Judd said the red tide has stabilized off the coast, but that local officials are concerned that it will enter the Laguna Madre, a nursery for shrimp, oysters and other fish located between

Port Isabel and South Padre Island.

"There's really nothing to prevent moving in there," Judd said. "It can happen at night."

Merchants along the Texas coast have complained that publicity about the red tide has hurt business and scared off tourists.

Joby Reed, manager of the Water Oyster Bar, located two blocks from Christi Bay, said national attention has hurt business.

"It doesn't really seem to bother the people. They know that the restaurants are not going to sell (contaminated) oysters," Reed said. "But tourists, they're worried about it."

Health officials say eating contaminated fish could lead to nausea and diarrhea.

Oysters, clams and mussels filter the toxins and retain it in their systems for weeks.

Dr. Don Hockaday, educational assistant at the Pan American laboratory, said there is a table for the red tide to disintegrate when temperatures dip below 60 degrees.

"There are literally billions and billions of organisms. You can kill them in some ways, but not in others and the blooms are still there," he said.
